.... a few more details:

Great Security

To address the issue of credit and debit card fraud, leading card providers have worked together to develop a new global standard in card security - microchip technology. The microchip is a smart chip, which appears as a metallic square embedded on the left hand side on the front of the card. Like the magnetic stripe on the back of current VISA cards, the embedded microchip stores your account details – account name, number and account expiry date. But unlike the magnetic stripe, the microchip is virtually impossible to copy, giving you the best possible level of protection against counterfeiting, card skimming and other fraudulent use.

What's new?

With this new technology, instead of swiping your card, you may soon be asked to insert your card in new EFTPOS terminals being installed in merchants around Australia. The card remains in the terminal throughout the transaction and confirms your identity and transaction authorisation by requesting your PIN. Until all EFTPOS terminals are upgraded, you may still be asked at some stores, to swipe your card & either sign or enter your PIN.

A smart addition to your wallet or purse?

You can use your VISA Debit Card at ATMs, when purchasing online, via mail order or over the phone. If you are travelling overseas, we suggest you memorise your PIN as this is now the preferred payment authorisation method for most merchants. Plus, you are still using your own money from your own account so it's easy to control your spending.
